Batteries are a driving force for a variety of innovations as we move towards a sustainable society

Batteries are used in an array of applications, and their performance can be a driving force for a variety of innovations and new lifestyles. The development and production of high-quality batteries will play an essential role as we work to realize a sustainable society. At the same time therefore, growing improvements in battery life cycle assessment have become a major priority. the focus on reducing CO2 emissions throughout the entire life cycle by means of improvements in manufacturing processes and reuse of high-quality batteries is increasing. HIOKI battery testers are helping resolve these issues through an electrical measurement approach.

2 Rectification Methods: True RMS and Mean

There are two methods for converting current into RMS values: the true RMS method (true RMS value indication) and the mean method (mean rectification RMS value indication). Although both methods yield the same value for undistorted sine waves, distortion of the waveform causes the values to diverge.

True RMS RMS value method (true RMS value indication)

The waveform including harmonic components is calculated according to an RMS calculation formula and displayed.

MEAN Mean method (mean rectification RMS value indication)

The input waveform is treated as an undistorted sine wave (single frequency only). The AC signal mean is calculated, converted to an RMS value, and displayed. The measurement error increases when the waveform is distorted.

*Widespread use of equipment such as inverter devices and switching power supplies has made it more common for current waveforms being measured to be distorted. It is recommended to use a measuring instrument that uses the true RMS method to ensure accurate measurement.

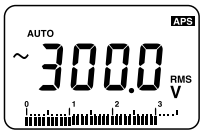
3 Accuracy and tolerances

● *f.s.* *(maximum display, or length of scale, ... full-scale)*

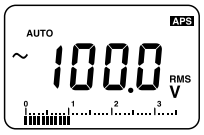
Signifies the maximum display (scale) value or the length of the scale (in cases where the scale consists of unequal increments or where the maximum value cannot be defined). In general, this is the range value (the value written on the range selector, or equivalent) currently in use. However, be aware that in cases where the maximum display value is 2000V but the range value is only 600V, the maximum display value (scale value) is still used as the f.s. value.



300V range

● *rdg* *(displayed or indicated value, ... reading value)*

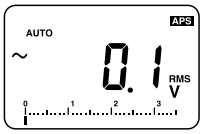
This signifies the value actually being measured, i.e., the value that is currently indicated or displayed by the measuring instrument.



Measuring 100 V using the 300 V range

● *dgt* *(digital resolution, ... digit)*

Signifies the smallest display unit on a digital measuring instrument, i.e., the value displayed when the last digit on the digital display is "1". Essentially, this indicates an error of 1 digit (based on decimal processing in analog-to-digital conversion), but in actuality this is the digit error combined with the f.s. error converted to a fraction of a digit unit. The accuracy associated with a particular measured value as shown in the product specifications is derived from these values.



In the 300 V range, the 0.1 V digit is the smallest digit

Example accuracy calculations

[Example accuracy calculation 1] (when the accuracy notation combines rdg and dgt)

Accuracy specification: ±1.0% rdg ±3 dgt
Measurement range: 300.0 V
Measured value: 100.0 V

Since the value being measured is 100.0 V:
(A) Reading error (±% rdg): ±1.0% of 100.0 V = ±1.0 V
(B) Digit error (dgt): Since the maximum resolution is 0.1 V, ±3 dgt = ±0.3 V
(C) Total error (A+B): ±1.3 V
Based on the total error (C), the error boundary values for a measured value of 100.0 V would be 98.7 V to 101.3 V.

[Example accuracy calculation 2] (when the accuracy notation combines rdg and f.s.)

Accuracy specification: ±0.2% rdg ±0.1% f.s.
Measurement range: 300.00 V
Measured value: 100.00 V

Since the value being measured is 100.00 V:
(A) Reading error (±% rdg): ±0.2% of 100.00 V = ±0.20 V
(B) Full-scale error (±% f.s.): ±0.1% of 300 V = ±0.30 V
(C) Total error (A+B): ±0.50 V
Based on the total error (C), the error boundary values for a measured value of 100.00 V would be 99.50 V and 100.50 V.

This Electrical Measuring Instruments General Catalog provides a product outline. For more detailed information, please refer to individual product catalogs and series catalogs, which group together similar products.

To help you use measuring instruments safely, the following information is provided in each product's Instruction Manual under "Specifications":
- Rated voltage to ground: The measurement point's voltage level relative to ground, Measurement Category, Anticipated transient overvoltage, etc.
- Location for use: Pollution Degree 2, indoor, altitude no more than 2000 m, etc.

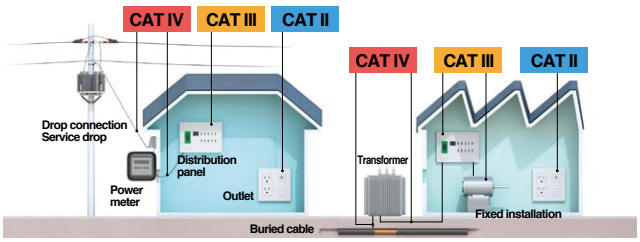
1 Measurement Category

Under safety standards (EN61010 Series, JIS C 1010 Series), measurement is classified into Categories II to IV according to the measurement point's rated voltage to ground, current capacity (size of current that flows in a short-circuit fault), etc., and the transient overvoltage that occurs at the measurement point.

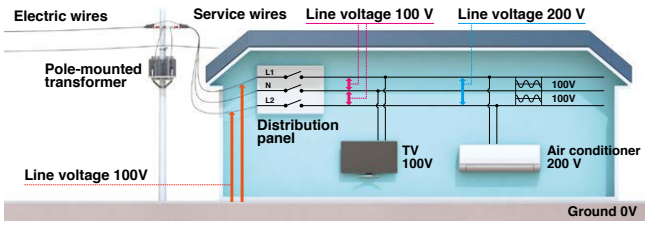
- **•Category II** Measurement at a point from the power plug to the equipment's power circuits, where equipment is directly connected to an outlet.
- **•Category III** Measurement at a point on the power distribution cabling or power supply circuits, or at a point from the distribution panel to a distribution terminal behind an outlet, where equipment (for example a fixed installation) takes electricity directly from a distribution panel.
- **•Category IV** Measurement at a point on a service drop to a building, or on the line from the drop connection to the power meter or distribution panel.

The measurement instrument's Category is marked as "CAT II", CAT III" or "CAT IV" near the measurement terminals.

Measurement Category

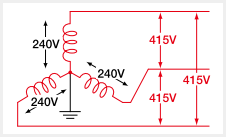


Rated voltage to ground



How to read a category indication

Three-phase three-wire (3P3W) system, 400 V line



*** Voltage indications**
Black: Voltage to ground (including line-to-line voltage)
Red: Line-to-line voltage

With the 400 V line in the figure, the line-to-line voltage is 415 V, whereas the voltage to ground is no more than 240 V (300 V).

Never measure a measurement point with a higher category number than the category indicated on the measuring instrument. Doing so could lead to a serious accident such as electric shock.

2 Anticipated Transient Overvoltage

Power lines in factories and similar facilities will at times include transient overvoltage (impulse voltage) that is around 10 times the power source voltage. The transient overvoltage of the measurement points must be predicted in advance, and the instrument will need a safety design that will enable it to withstand such overvoltage.

Assuming 600 V for the measurement point's voltage to ground, a Category IV location could potentially include transient overvoltage of 8000 V.
Hence, CAT IV measurement instruments are designed to withstand transient overvoltage of 8000 V.
CAT III measurement instruments can only withstand up to 6000 V, so if 8000 V transient overvoltage enters, it will cause insulation breakdown that could result in electric shock.

Safety standards stipulate values such as the following for transient overvoltage, according to the voltage to ground and the measurement category.

Rated voltage to ground [V]	Transient overvoltage [V]		
	CAT II	CAT III	CAT IV
300	2500	4000	6000
600	4000	6000	8000
1000	6000	8000	12000

3 Pollution Degrees

If contaminants adhere to the surfaces of a measuring instrument, its insulation performance will fall and it will pose a high risk of electric shock.
Safety standards classify environments where measuring instruments are used into Pollution Degrees 1 to 4.

- **Pollution Degree 1**
  Environment with no pollution, or with only dry contaminants present (non-conductive dirt, dust, etc.), which will not affect a measuring instrument's insulation performance.
- **Pollution Degree 2**
  Environment with only dry contaminants present (non-conductive dirt, dust, etc.), but where condensation could form on a measuring instrument, in which case the contaminants could cause a temporary drop in its insulation performance.
- **Pollution Degree 3**
  Environment with conductive contaminants present (water, soil, etc.), and which therefore could affect a measuring instrument's insulation performance, depending on how (much) contaminant adheres to it. Or, environment with high humidity, where even non-conductive contaminants could be a problem, since due to condensation a measuring instrument could have wet surfaces for relatively long periods.
- **Pollution Degree 4**
  Environment that could cause a prolonged drop in a measuring instrument's insulation performance, due to conductive contaminants (water, soil and the like) adhering to its surfaces, or to being wetted by rain.

A "Pollution Degree 2" marking on a measurement instrument means that it can be used without detriment to safety in environments of Pollution Degree 1 or 2 described above,, and a "Pollution Degree 3" marking means the measurement instrument can be used in environments of Pollution Degrees 1 to 3.

4 Altitude

As altitude (elevation) rises, the air pressure decreases and flashover (breakdown and discharge through the air) becomes more likely to occur.
Accordingly, safety standards stipulate safety design that assumes use locations of altitude no more than 2000 m for measuring instruments.
If measuring instruments are used in locations of altitude exceeding 2000 m, the spaces between their parts that are under hazardous voltage and their parts that humans touch should be made larger as a precaution.

Capture Voltage Signals from Outside the Wire Cover

NON-CONTACT AC VOLTAGE PROBE **SP3000**

CE

- Observe waveforms with an oscilloscope or a Hioki Memory HiCorder by visualizing signals from electric equipment simply by applying the probe to the wire's insulation
- Capture LIN and other communications signals
- Ideal for applications where:
  - Miniaturization of devices and use of waterproof connectors make it impossible to establish contact with metal terminals
  - Connectors can't be removed due to reduced ability to reproduce phenomena
  - There is need to avoid tearing the wire insulation so as to prevent risk of damage to the sensor due to static electricity

Logging Multi-point Data Has Never Been So Easy with a Data Wireless Logger

WIRELESS LOGGING STATION LR8410

- Capture logging data using Bluetooth® wireless technology. Install logging modules in hard-to-reach locations (over line-of-sight distances of up to 30 meters *1)

  (*1) The presence of obstructions may shorten this range. In addition, radio wave intensities, which are indicated with the antenna-like indicators, vary depending on units even while these units are operating in the same environment.
- Measurement units have built-in buffer memory so that measurement data can be saved if communication is temporarily disrupted.
- Choose an input unit based on the parameters you wish to measure (15-channel and 2-channel units are available)
- Easily add up to 7 input units wirelessly to keep your environment free of tangled wires (for a total of up to 105 channels when using 15-channel units)
- 100 msec simultaneous sampling across all channels using rapid scanning method
- Quick Set guide makes configuration a breeze
- Can receive data from LR8410 Link compatible products (Ver. 1.40 or later)

Model No. (Order Code) **LR8410-20** (English model, main unit only)

**1: The thresholds for determining the pass/fail condition of a battery depends on the specifications and standards of the battery manufacturer, battery type, capacity, etc. It is important and necessary to always conduct battery testing against the internal resistance and terminal voltage of a new or reference battery. In some cases, it may be difficult to determine the deterioration state of traditional open type (liquid) lead-acid or alkaline batteries which demonstrate smaller changes in internal resistance than sealed lead acid batteries. *2: Audio generated by Bluetooth®-connected device. *3: Data can be downloaded to tablets and smartphones using Hioki's dedicated apps available from the Google Play or App Store. *Note: *The indicated value for three-phase power is based on the assumption of a balanced condition and sine wave without distortion at 50/60 Hz. Accurate measurement is not possible on an unbalanced or inverter controlled three-phase line. Also, if the phase (zero cross) cannot be detected due to significant waveform distortion, it cannot be measured nor displayed.*
**The power factor / phase angle are values obtained from the zero cross of the current and voltage. If the phase (zero cross) cannot be detected due to significant waveform distortion, it cannot be measured nor displayed.*

**1) Phase angle obtained from zero cross of current / voltage.*
**2) Harmonics levels can be displayed with application software (GENNECT Cross)*

Example Applications - Providing True Current Measurement with Unmatched Measurement Range and Noise Resistance -

High-Precision and Efficiency Testing of SiC/GaN Inverters

A wide range and minimal voltage current phase error are essential for the highly precise measurement of switching frequency power during PWM output.

The CT6904, which features flat frequency characteristics over a wide range, provides accurate measurement of not only fundamental wave current but also switching frequency current. Since the CT6904 achieves both wide-range and highly accurate measurement performance, it can be used in combination with a power analyzer for more precise measurements of inverter input/output power and efficiency than ever before.

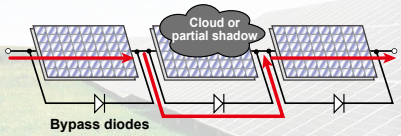
Easily inspect bypass diodes for open and short-circuit faults even in broad daylight

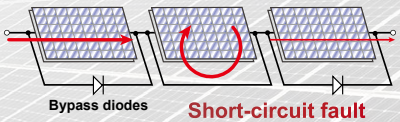
Reference Issues caused by faulty bypass diodes

Normal reading: Current is routed around panels that are covered by shadows



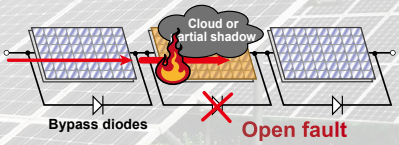
When a solar panel is obscured by a partial shadow (or when it fails), the current bypasses the panel in order prevent any drop-off in generating efficiency.

Short-circuit fault: Generating capacity falls



When a short-circuit fault occurs, **the generated current flows in a loop, making it impossible to capture the generated power, resulting in lowered efficiency.**

Open fault: Potential fire



When an open fault occurs, **current is forced to flow to the defective cell when it's covered by a shadow, causing the panel to heat up and posing the risk of fire.**

Key Point

Absolute prevention of short-circuit accidents (DT4255)

In the event of erroneous operation, a protective circuit functions to prevent a short-circuit. A current-limiting resistor limits the short-circuit current if damage to the tester's circuitry results in a short-circuit condition, and a fast-blow fuse quickly disconnects the circuit to ensure safety.

■ Basic specifications (Accuracy guaranteed for 1 year, Post-adjustment accuracy guaranteed for 1 year)

Measurement principle	Instrument has two cores for voltage injection and current measurement. From the defined voltage and measured current, the total circuit loop resistance is calculated Note: For multi grounded systems only. In a multi-grounded system, the larger the number of grounding poles, the more accurate the measured value.
Earthing resistance range	0.20 Ω (0.01 Ω resolution) to 1600 Ω (20 Ω resolution), 10 ranges, Zero suppression: Less than 0.02 Ω, Accuracy: ±1.5 % rdg. ±0.02 Ω
AC Current range	20.00 mA (0.01 mA resolution) to 60.0 A (0.1 A resolution), 5 ranges, Zero suppression: Less than 0.05 mA, Accuracy: ±2.0 % rdg. ±0.05 mA (30 Hz to 400 Hz, True RMS), Crest factor 5.0 or less (for the 60 A range, 1.7 or less)
Maximum input current (Current measurement)	100 A AC continuous, AC 200 A for 2 minutes or shorter (at 50 Hz/60 Hz, requires derating at frequency)

By synergizing complementary technologies, HIOKI delivers solutions that fully meet next-generation needs.

Ours is a global era underpinned by state-of-the-art electronic technologies. HIOKI's bare board testing systems and populated board testing systems are hard at work in plants that manufacture printed circuit boards with increasingly advanced, high-density designs. HIOKI's printed circuit board testing systems are an ideal choice for manufacturing plants seeking to achieve rational production through high precision, reliability, and ease of use and for companies striving to ship products with the world's fastest cycle times.

With product series ranging from flying probe systems designed to test small lots of boards representing multiple models to bed-of-nails systems engineered for use with mass-produced boards, HIOKI's ATE offerings deliver optimized functionality and cost performance for bare board and populated board testing processes. HIOKI's printed circuit board testing systems, which can accommodate BGAs, CSPs, boards with embedded passive and active devices, and silicon interposers, continue to evolve. We invite you to put them to work in your own demanding applications.

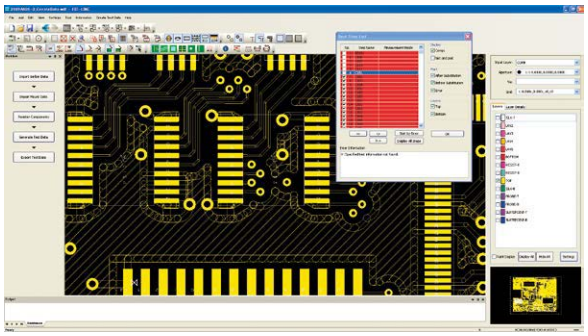
Data Creation Software for Populated Board Testing

FIT-LINE INSPECTION DATA CREATION SYSTEM **UA1780**



The UA1780 generates data from Gerber data and mounting data while referencing component library information

- No need for camera-based teaching
- No need to visually trace patterns under components
- Easy generation of high-quality test data without boards
- Support for the new FA1240 data format

Thanks to these features, programs can be created with plenty of time to spare before the prototyping stage. Anybody can generate high-quality test programs in a short period of time by using net information that has been reverse-generated from Gerber data and component information libraries. The UA1780 delivers maximum performance when used in conjunction with HIOKI's new FA1240-60 flying probe tester.

Embed Electronic Circuit Board Component, Mounting Status, and Function Testing into Existing Equipment

IN-CIRCUIT TESTER **FA1220**

FA1220 Main unit

Computer and peripherals not included in FA1220. A separate control computer is required in order to use the FA1220 on a standalone basis.

- Functionality has been consolidated in a single, desktop tower that can be easily embedded in existing equipment
- Extensive function testing
- Electrolytic capacitor and IC reverse insertion detection
- Macro-testing function to increase test efficiency
- Four-terminal low-resistance measurement for stable measurement of low resistance

Model No. (Order Code) **FA1220** (Main unit only)

- Data from the legacy 1101 and 1102 cannot be converted for use by the 1220 (FA1220) because Hioki is unable to supply computers that can run the 1137 Support Software.
- Data compatibility between the FA1220/FA1221 and legacy products (1220-00/-01/-02/-11/-50/-51/-52/-55): Although data created for legacy products can be used, such data is not fully compatible with the FA1220/FA1221. It may be necessary to perform stray capacitance acquisition, wiring resistance acquisition, S/O data acquisition, IC data acquisition, and component test debugging. In particular, it may be necessary to reacquire stray capacitance in applications that involve measurement of minuscule capacitance values.

Product Warranties

HIOKI products are generally covered by a three-year warranty.

Product warranty

In the event HIOKI is responsible for the failure of a product during the warranty term beginning on the date of purchase (or beginning in the month the product was manufactured if the date of purchase is unclear), we will repair or replace the product free of charge.

Warranty scope

We check products on a standalone basis to verify their specifications, performance, and functionality. Although we verify proper operation of components that are connected to HIOKI products in standard configurations, we ask that customers verify proper operation of their HIOKI products when connected to other manufacturers' products. The scope of HIOKI's warranty is limited to HIOKI products. Connected devices and issues caused by connected devices are considered outside the scope of the warranty. In the event of physical damage, any compensation that might be provided by HIOKI is limited to the purchase price of the product.

Accuracy guarantee

For products with an accuracy guarantee, we guarantee the level of accuracy indicated in the specifications for a certain period of time following shipment from the factory. In the event of an accuracy defect during that period of time, we will adjust the product free of charge.

Calibration, adjustment, and repair service

Calibrated products

No warranty term is provided. The period of time for which a calibration is considered valid must be determined by the customer. Calibration includes a statement of values as of the date of calibration as calibration results.

Calibration interval	:	We suggest a product-specific accuracy guarantee term as the recommended calibration interval.

Adjusted products

If an adjusted product falls out of accuracy during the post-adjustment accuracy guarantee term, we will readjust it free of charge.

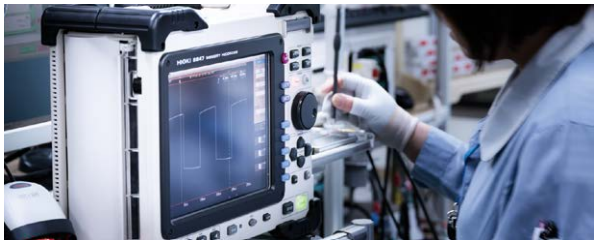
Guarantee term	:	The post-adjustment accuracy guarantee term is determined on a product-by-product basis. With some exceptions, we offer a post-adjustment accuracy guarantee for the duration of the recommended accuracy interval. The month of adjustment serves as the starting point when calculating the duration of the guarantee.
Guarantee conditions	:	The post-adjustment accuracy guarantee is intended to guarantee the accuracy of measured values. It is not a product warranty. If the product's falling out of accuracy is the result of the service life or deterioration of a part, the customer will be charged for the repair. If the product's falling out of accuracy is deemed likely to be the result of damage or the environment in which the product was operated or stored, the customer will be charged for the repair. If we conclude that a product received from a customer is likely to fall out of accuracy after shipment, we may contact the customer and decline to provide a post-adjustment accuracy guarantee. These terms apply to calibration and adjustment performed at HIOKI E.E. CORPORATION headquarters.

Repaired products

If, within six months of the original repair, HIOKI is responsible for an issue requiring an additional repair (a repair of the same issue) of a product that has been used as described in its user manual, we will repair it free of charge.

Repair term	:	We may improve products or switch models without notice in order to enhance the competitiveness of our products and our productivity. We will repair discontinued products for a minimum of five years from the date of their discontinuation, although we may elect to propose that the customer switch to an alternative model if it is difficult to repair a product due to social or economic conditions. *Once five years has passed since a product's discontinuation, we will only accept inspection and calibration requests for that product if we are able to perform that work in-house.

Quality of HIOKI's calibration, adjustment, and repair service



80 years of history and fine-grained, expert service
Technicians performing calibration, adjustment, and repair work undergo in-house training to ensure they possess the specialized expertise and skills that such work demands. We carry out rigorous inspections that extend from product functionality to accessories, including to assess potential wiring breaks in probes, remaining battery life, and display performance.

Precise calibration and adjustment guidelines compiled by product designers
We determine everything from the procedures for measuring instrument functionality checks to calibration points based on the results of reviews conducted by designers who are well versed in the characteristics of products' internal circuitry and the principles that underlie their operation. In this way, we are able to provide optimal, extensive calibration and adjustment service as only the manufacturer can.

Highly reliable service that's traceable to national standards
The standard devices we use to calibrate and adjust products are all linked to national standards, ensuring that we can issue inspection reports with accurate, reliable calibrated values.

Comprehensive calibration, adjustment, and repair service with fast turnaround
If we discover a malfunction or failure during the calibration process, we'll contact you to let you know where the problem is and what's necessary to address it. If you wish, we'll then repair the product. This capability eliminates unnecessary back-and-forth so you can put your product back to work as soon as possible.

(3) Applying for calibration, adjustment, or repair service

From the distributor where you purchased the product
Download the "Repair/Calibration Request Confirmation Form" from the Hioki website, then complete the required information and take the form along with your instrument to the distributor from whom you purchased the product. If you wish to receive a quotation before requesting service, please send just the "Repair/Calibration Request Confirmation Form" to the distributor. (For distributor information, please contact your nearest Hioki subsidiary.)

Calibration

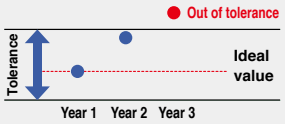
Calibration provides a way to check the condition of a measuring instrument by comparing the ideal value indicated by a standard device with the value indicated by the instrument being calibrated.

Adjustment

Adjustment corrects for the difference between the ideal value indicated by a standard device and the value indicated by the instrument being adjusted. HIOKI recommends that calibration and adjustment be performed together. Adjustment lets you use your instrument with ideal values.
*Products that have undergone adjustment are covered by a post-adjustment accuracy guarantee.

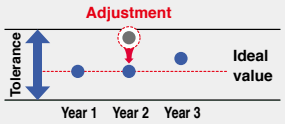
General calibration only

Although the instrument may perform to tolerance at the time of calibration, it may fall out of tolerance subsequently.



General calibration and adjustment

By adjusting the instrument at the time of calibration, it is possible to compensate for divergence from true values so that the performance of the instrument can be maintained subsequently.



HIOKI products are designed so that they will not fall out of tolerance before the calibration interval is up as long as calibration with adjustment is performed at the recommended calibration interval and the instrument is used and stored under the specified environmental conditions. If an instrument falls out of tolerance, it may be due to an issue that needs to be repaired.

Service capability and warranty duration

You can find out whether HIOKI accepts repair and calibration requests for your instrument, associated lead times if so, and the information listed below simply by entering the product model number on HIOKI's website.

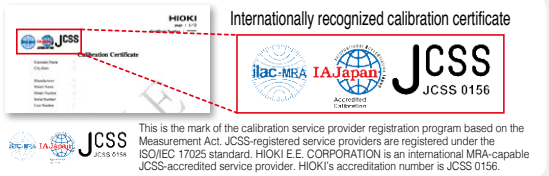
JCSS and JCSS Calibration

Difference between general calibration and 17025 calibration (JCSS)

NITE (National Institute of Technology and Evaluation)
└ IA Japan (a NITE-accredited center)
JCSS (Measurement Act calibration service provider registration program)
International MRA (international mutual recognition agreement)
Screening and registration
Calibration service provider
Issuance



This is the mark of the calibration service provider registration program based on the Measurement Act. JCSS-registered service providers are registered under the ISO/IEC 17025 standard. HIOKI E.E. CORPORATION is an international MRA-capable JCSS-accredited service provider. HIOKI's accreditation number is JCSS 0156.

JCSS calibration is a type of third-party-accredited calibration based on ISO/IEC 17025. General calibration is a type of calibration determined by HIOKI based on ISO 9001. HIOKI can issue calibration certificates bearing the JCSS mark for instruments that have undergone JCSS certification, and they are valid internationally since they are international MRA-compliant.

Differences in calibration points

General calibration
Calibration is performed for all parameters that need to be checked in order to maintain the performance of the measuring instrument as determined by the product designer.

17025 calibration (JCSS)
Calibration is performed using points registered as the JCSS calibration range and selected by the customer.

Differences in information on calibration documents

- Inaccuracies: Not included
- Traceability chart: Yes

17025 calibration (JCSS)
- Calibration results: Included on calibration certificate
- Inaccuracies: Included on calibration certificate
- Traceability chart: No
